Art Unit: 1656

Claims 1-9 are currently pending and are under examination.

The disclosure is objected to because of the following informalities: The priority information must be provided at page 1 of the specification.

Appropriate correction is required.

This application does not contain an abstract of the disclosure as required by 37 CFR 1.72(b). An abstract on a separate sheet is required.

Claims 4-9 are objected to under 37 CFR 1.75(c) as being in improper form because a multiple dependent claim cannot depend from any other multiple dependent claim. See MPEP § 608.01(n). Accordingly, the claims 4-9 have not been further treated on the merits.

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claim 2 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

In Claim 2, it is not clear what a functionally equivalent gene is considered to be.

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-3 are rejected under 35 U.S.C. 102(b) as being anticipated by Yamamoto et al. (September 2001; Regulation of the *glv* operon in *Bacillus subtilis*: YfiA (GlvR) is a positive regulator of the operon that is repressed through CcpA and cre. Journal of Bacteriology. 183(17): 5110-5121).

Yamamoto et al. teach *B. subtilis* in which *glvR* has been disrupted and transformed to express *glvR*-LacZ transcriptional fusion protein. (See strain GLVR-PSP in Fig. 6; see page 5117, right col; see *B. subtilis* strains and plasmid codes in the tables on page 5111).

Yamamoto et al. teach *B. subtilis* in which the *glvR* or *glvC* has been disrupted, and transformed to express kanamycin. See page 5114, para. 1.

Therefore, Yamamoto et al. teach a recombinant microorganism in which a gene that participates in membrane permeation of maltose has been deleted or knocked-out and transformed with a gene encoding a heterologous protein such as *glvR*-LacZ transcriptional fusion protein or kanamycin (Claim 1), wherein the gene participating in the membrane permeation of maltose is a *B. subtilis* *glvR* or *glvC* (Claim 2), and wherein the microorganism is *B. subtilis* or belonging to the genus *Bacillus* (Claim 3).

No Claims are allowed.
